GENERAL INFORMATION:
APPLICANT: Keith Weinstock et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC-016P
CURRENT APPLICATION NUMBER: US/60/096,409A
CURRENT FILING DATE: 1998-08-13
NUMBER OF SEQ ID NOS: 28206
SEQ ID NO 19382
LENGTH: 373

GENERAL INFORMATION:
APPLICANT: Keith Weinstock et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.132
CURRENT APPLICATION NUMBER: US/09/248,796
CURRENT FILING DATE: 1999-02-12
NUMBER OF SEQ ID NOS: 28206
SEQ ID NO 19382
LENGTH: 373
TYPE: PRT
ORGANISM: Candida albicans

ID W67579 standard; peptide; 21 AA.

AC W67579.

AC W67579.

DE W67579.

DE T-cell epitope peptide #5 for chimeric fimbrin/T-cell epitope peptide.

KW Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope;

KW Minunogenic composition; immune response.

Synthetic.

BN USS843464-A.

PR 04-14-14-14-14.

PR 1 Synthetic chimeric fimbrin peptide - useful for vaccination against Disclosure; Column 4; IGPP; English.

CC comprising a non-typable Haemophilus influenzae fimbrin peptide is CC used in immunogenic compositions which induce an immunogenic compositions with induced in immunogenic compositi

IS-DEC-1998 (first entry)

Fetnus toxin; vaccine, antibody: carbohydrate peptide conjugate;

Gentlement poly-lysine; epitope: tumour.

Gentlement poly-lysine; epitope: temour.

For your poly-lysine; epitope: temour.

For your poly-lysine; epitope: temour.

For your poly-lysine; poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: the proposition of the comprises a carrier with adendiment poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an enthopy puritied from biological fluid or calls of organisms administered with the carbohydrate peptide conjugate, antibody and enthopy artities from biological fluid or calls of organisms administered with the carbohydrate peptide conjugate, antibody and enthopy purities from biological fluid or calls of organisms administered with the carbohydrate peptide conjugate, where the carbohydrate peptide conjugate, which the carbohydrate peptide conjugate, which the carbohydrate peptide conjugate, which the carbohydrate peptide conjugate stimulates of support an immune response of an persent sequence contrapped to tumours. They can be used to enhance and animals against bacterial infections against virus, they can be used to enhance and animals against bacterial infections caused by hepatitis virus, HIV or oytomegalo conjugate stimulating undesired immune responses, Inc composition in response without stimulating undesired immune responses, Inc composition in casponses, of humans and animals against bearing humans and signals. The year as equence contrapported to minimals and epitope in a carbohydrate peptide conjugate stimulates to residues 947-967 of tetanus of conium and peptide conjugate stimulating conference again
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                        falciparum

Claim 1; page 13; 16pp; English.

Claim 1; page 13; 16pp; English.

This peptide corresps. to residues 947-967 of Tetanus toxin. It can be used as a universal carrier for the prepn. of an immunogenic conjugate. It is covalently bound to a peptide or polysaccharide conjugate. It is covalently bound to a peptide or polysaccharide conjugate can be used as a vaccine for malaria. This peptide is recognised by different T-contains 2 epitopes: (a) 953-967, recognised by DR5-restricted clones; and (b) 947-960, recognised by all other DR and DP-crestricted clones.

Crestricted clones.

Claim 11; Page 43; 72pp; English.
A helper T-cell epitope (W06130) comprises amino acids 947-967
of tetanus toxoid protein. It can be utilised in novel peptide
vaccines (see also W06129, W06132) also including B-cell
epitope(s) from human or rabbit cholesteryl ester transfer
protein (CETP) to elicit an immune response against endogenous
CETP activity, thereby treating or preventing a cardiovascular
disease, such as atherosclerosis.

```
The present sequence represents a broad range helper T cell epitope of the tetanus protein. It can be used in DNA plasmid-based vaccines against cholesteryl ester transfer proteins (CETPs). CETPs mediate the transfer of cholesteryl esters from high density lipoprotein (HDL) transfer of cholesteryl esters from high density lipoprotein (HDL) and vice versa. An increased CETP activity produces an atherogenic lipoprotein profile and induces atherosclerosis. A DNA plasmid-based cipoprotein profile and induces a least one B cell epitope of CETP cipoprotein frame with at least one segment encoding a broad range helper cipoprotein from a loope. The vaccines can be used to elevate the ratio of circulating HDL to circulating LDL, VLDL or total cholesterol in a human. The vaccine can be used to produce anti-CETP antibodies in vivo and for treating cardiovascular disease.
                                                                                                                                                                                                                                                                                                                  ÷

Claim 7; Page 62; 95pp; English.

This T-cell antigen TT3 peptide may be attached to a core peptide contained in one of the 2 subunits of an alpha-helical coiled-coil heterodimer. Each core peptide is comprised of terminal and internal AA repeat sequences. This peptide antigen is attached to the core peptide through covalent linkages to certain AA of the internal repeats. The 2 subunits of the heterodimer are arranged in a stable alpha-helical coiled-coil configuration having a 1:1 stoichiometry, and the peptide antigen is disposed toward the outer surfaces of the configuration. The heterodimer may be used as a synthetic vaccine (optionally multivalent) or to generate

Example 7; Column 27; 57pp; English.

This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor (EGFR), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody) comprising: (a) an anti-Fc receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to EGFR. The method can be used for treating cancers especially be administered prophylactically to vaccinate a subject against infection by a target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

Synthetic immunogenic peptides are provided in which a universal stimulator is linked to a peptide or protein hapten containing B and/or cytotoxic T lymphocyte epitopes, giving a product which capotent immune responses to the coupled peptide or protein. The potent immune responses to the coupled peptide in member stimulator consists of (A) a promiscuous helper I cell epitope (T which elicits an immune response to the coupled peptide in member

The national falciparum

S claim 10: Page 15: 22pp; English.

C each of the alpha and epsilon amino groups

is substituted by Lys, both of the latter

two Lys residues being substituted in each

of their alpha and epsilon amino groups by

(NANP)60YIKANSKFIGITEFNNFTVSFWLRVPKVSASHLE"

The peptide is a specific example of highly generic

immunogenic substituted lysines or polylysines having a number n

c where n is 1-15) of L-lysine amino acid residues of alpha and

epsilon amide linkage, where (n+1)/2 of the alpha amino groups

and/or (n+1)/2 of the epsilon amino groups are substituted with

polypeptides consisting of one or more plasmodial B epitopes

covalently bound to one or more peptides with an amino acid sequence

corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA

C OT LYTEANSKFIGITE.

a heterogeneous population expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the invasin and Th domains and between the immune stimulator and hapten components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component. The present sequence represents an LHRH-containing, invasin-free immunogenic peptide as above which can be used as a potent vaccine for treating e.g. prostatic hyperplasia, androgen-dependent carcinoma, prostatic carcinoma, testicular carcinoma, endometriosis, benign uterine tumours, recurrent functional ovarian cysts, (severe) chancetion of infertility.

Claim 8; Page 15; 22pp; English.

The peptide is a specific example of highly generic
immunogenic substituted lysines or polylysines having a number n
(where n is 1-15) of L-lysine amino acid residues of alpha and epsilon amide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPRVSASHLEA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-Plasmodium antibodies in blood, serum and blood-samples. Determination can be effected by ELISA.

Claim 13; Page 16; 22pp; English.

The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon amide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid seque corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHIOU OX QYIKANSKFIGITE.

Claim 9; Page 15; 22pp; English.

The peptide is a specific example of highly generic
immunogenic substituted lysines or polylysines having a number n
(where n is 1-15) of L-lysine amino acid residues of alpha and
epsilon amide linkage, where (n+1)/2 of the alpha amino groups
and/or (n+1)/2 of the epsilon amino groups are substituted with
polypeptides consisting of one or more plasmodial B epitopes
covalently bound to one or more peptides with an amino acid seque
corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHI
or QYIKANSKFIGITE.
                                                                                                                                                                                                     antigens

The (G+C) content of the synthetic gene is increased by 47% wrt native sequence. This eliminates six "terminator" regions which were found to be present in (A+T) rich regions. The terminators (termination/endo-nucleolytic processing/polyadenylation sites) were previously responsible for incomplete transcription of the mRNA. The elimination of these elements (using codon degeneracy provided for successful expression in yeast of the tetanus toxin
                                                                                                                                                                                                                                                                                                                                                                                yeas

Immunogenic luteinising hormone releasing hormone peptide(s) -
that suppress LHRH activity in males and females

Claim 7; Page 25; 213pp; English.

Synthetic immunogenic peptides are provided in which a universal immune

Synthetic immunogenic peptides are provided in which a universal immune

Synthetic immunogenic peptides are provided in which a universal immune

Stimulator is linked to a peptide or protein hapten containing B cell

and/or cytotoxic T lymphocyte epitopes, giving a product which causes

potent immune responses to the coupled peptide in members of

Stimulator consists of (A) a promiscuous helper T cell epitope (Th)

which elicits an immune response to the coupled peptide in members of

a heterogeneous population expressing diverse HLA phenotypes, and (B)

a adjuvant peptide sequence from the invasin protein of Yersinia.

Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the invasin and Th domains and between the immune stimulator and hapten

components. When the hapten is LHRH, then optionally the invasin domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in which a universal immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                domain
                                                                                                                                                                                                                                                                                R82571-91 are helper T cell epitopes which can be used in the preparation of a peptide immunogen that is useful in vaccines for treating allergic reactions. In the immunogen an IgE CH4 peptide is attached C-terminally to a series of amino acids including a helper T cell epitope. The immunogen may also opt. contain a fatty acid derivative, an invasin domain or alpha-NH2. The immunogen produces high titres of antibodies to the effector site in human IgE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IgE prodn. The immunogens may be used in either a radially branching multimeric form or a linearly arranged monomeric form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ....blt mast

Peptide immunogen useful in treatment of allergy - comprises

membrane-bound IgE epsilon-chain peptide synthesised linearly in

tandem with T helper epitope peptide

Claim 2; Page 18; 53pp; English.

W05957-W05616 represent helper T cell epitopes used in the peptide

immunogens of the invention. This sequence represents the tetanus toxin

helper T cell antigen. The peptides of the invention contain one of

these sequences, and a membrane-bound immunoglobulin E (IgE) fragment

(see W05595 and W05596). The peptide immunogens of the invention can be

used in vaccines for the immunotherapeutic treatment of allergenic

reactions, including allergic rihinitis, food allergies, anaphylaxis,

reactions, including allergic rihinitis, food allergies, anaphylaxis,

reactions, including allergic rihinitis, food allergies, anaphylaxis,

virally-induced asthma. The immunogens overcome the short effective

period of antihistamines, decongestants, and beta-2 agonists, while

preventing the broad immunosuppression of corticosteroids. The peptides

do not have the potential side effects of restlessness or sedation

(associated with antihistamines), associated increased morbidity in

sechnatics (as seen with beta-2 agonists) and adverse hormonal activities

(beginned of an activities and astroned activities)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  activities
                                                                                                                                                                                                                                                                  10-DEC-1996 (first entry)

Synthetic peptide-based immunogen contg. IgE CH4 peptide and helper

T cell epitope - useful for eliciting antibody prodn. for allergy

T cell epitope - useful for eliciting antibody prodn. for allergy

T cell epitope - useful for eliciting antibody prodn. for allergy

K82592-R82600 and R83560-R83581 are peptide immunogens that are

USECH4 peptide is attached C-terminally to a series of amino acids including a helper I cell epitope. The immunogen may also opt. contain a fatty acid or fatty acid derivative, an invasin domain or alpha-NH2.

CC in human IgE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IgE prodn. The immunogens

CC in human lgE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IgE prodn. The immunogens

CC may be used in either a radially branching multimeric form or a linearly arranged monomeric form.

SQ Sequence 32 AA;

"T cell peptide and helper on the immunogens of linearly arranged monomeric form.

"The Immunogen produces in either a radially branching multimeric form or a linearly arranged monomeric form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Wang CY;

S Claim 5; Page 69; 87pp; English.
S R82592-R82600 and R83560-R83581 are peptide immunogens; In the immunogens,
C useful in vaccines for treating allergic reactions. In the immunogens,
C useful in vaccines for treating allergic reactions. In the immunogens
C an IGE CH4 peptide is attached C-terminally to a series of amino acids
C including a helper T cell epitope. The immunogen may also opt. contain
C a fatty acid or fatty acid derivative, an invasin domain or alpha-NH2.
C The immunogen produces high titres of antibodies to the effector site
C The immunogen produces high titres of antibodies to the effector site
C The immunogen produces allergen-induced IgE prodn. The immunogens
C may be used in either a radially branching multimeric form or a
C linearly arranged monomeric form.

2-31 ##label DEF

The source of this protein was an extrachromosomal plasmid.

The precursor is cleaved by endogenous proteinase activity to form light (fragment A) and heavy (fragment B.C) chains that are covalently linked by an interchain disulfide bond (the individua chains are not toxic when separated). The amino end of the heavy chain (fragment B) can be separated from the carboxyl end (fragment C) by papain.

Fragment B forms ion channels in a lipid bilayer. Fragment C binds to gangliosides and may target the toxin to the motor end plate.

Fragment A is a zinc-dependent endopeptidase.

NAT. STRUCT. BIOL. 4:788-792(1997).

-!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77 BOND OF SYNAPTOBREVIN-2.

-!- CATALYTIC ACTIVITY: HYDROLYSIS OF 76-GLN-|-PHE-77 SYNAPTOBREVIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BRIDG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EMBL; X04436; G40770; -.

I'the ribosomal protein gene cluster of Mycoplasma capricolu MOL. GEN. GENET. 210:314-322(1987).
-!- FUNCTION: THIS SMALL UBIQUITOUS ENZYME IS ESSENTIAL FOF MAINTENANCE AND CELL GROWTH.
-!- CATALYTIC ACTIVITY: ATP + AMP = ADP + ADP.
-!- CATALYTIC ACTIVITY: ATP + AMP = ADP + ADP.
-!- SUBUNIT: MONOMER.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC.
-!- SIMILARITY: BELONGS TO THE ADENYLATE KINASE FAMILY.
-!- SIMILARITY: BELONGS TO THE ADENYLATE KINASE FAMILY.

T.Cloning and expression of gamma-glutamyl transpeptidase from isolated porcine brain capillaries.";

EUR. J. BIOCHEM. 183:693-698(1989).

C -!- CATALYTIC ACTIVITY: (5-L-GLUTAMYL)-PEPTIDE + AN AMINO ACID = PEPTIDE + 5-L-GLUTAMYL-AMINO ACID.

PEPTIDE + 5-L-GLUTAMYL-AMINO ACID.

-!- PATHWAY FOR THE SYNTHESIS AND DEGRADATION OF GLUTATHIONE.

C -!- SUBUNIT: THIS ENZYME CONSISTS OF TWO POLYPEPTIDE CHAINS, WHICH ARE SYNTHESIZED IN PRECURSOR FORM FROM A SINGLE POLYPEPTIDE.

C -!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN (PROBABLE).

C -!- SIMILARITY: STRONG, TO OTHER GGT ENZYMES AND TO GL-7ACA ACYLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

-!- FUNCTION: HYDROLYZES PEPTIDES CONTAINING BETWEEN 7 AN
ACIDS WITH A RATHER WIDE SPECIFICITY.

-!- COFACTOR: BINDS A ZINC ATOM (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M3 (ZINC MET)
ALSO KNOWN AS THE THIMEI OLIGOPEPTIDASE SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 601
